

Finding the Order Within CHAOS(S)

Ildikó Váncsa - ildiko@openinfra.dev

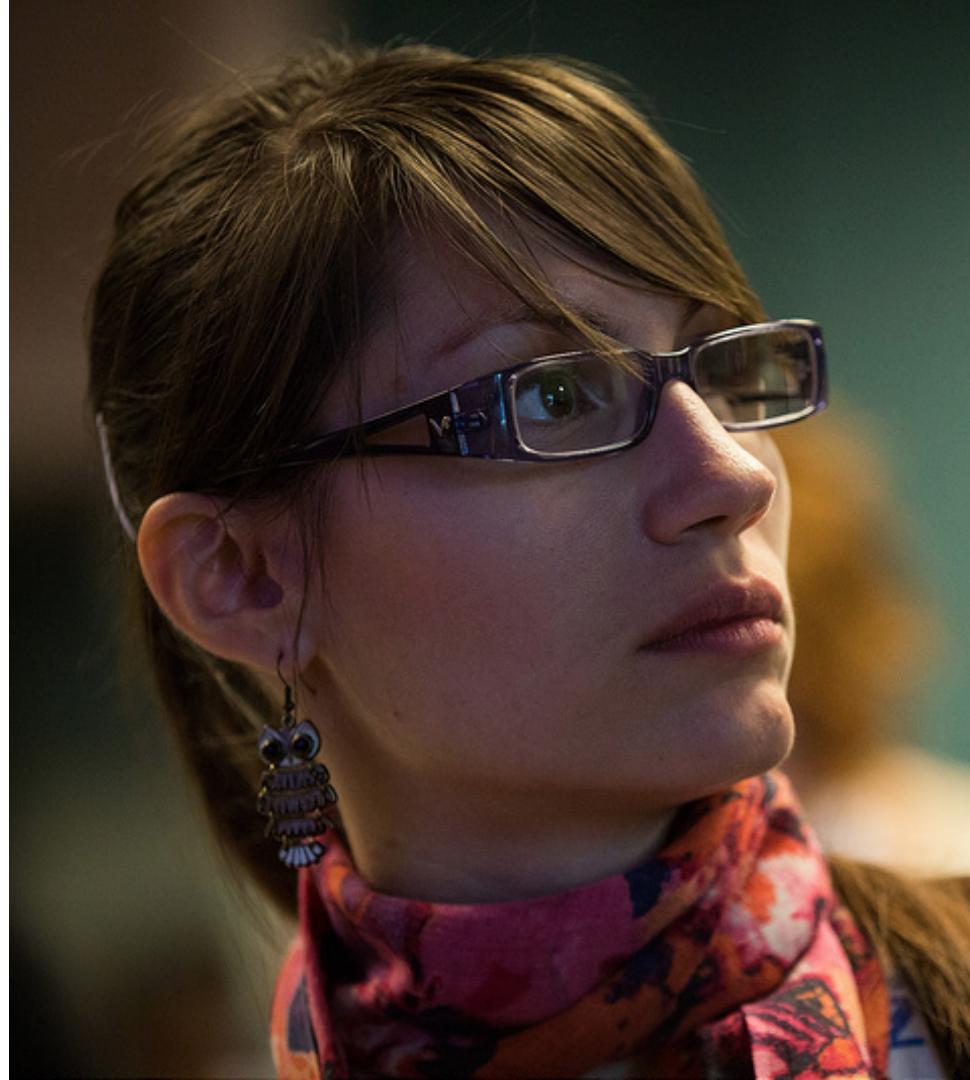

October, 2023

Ildikó Váncsa

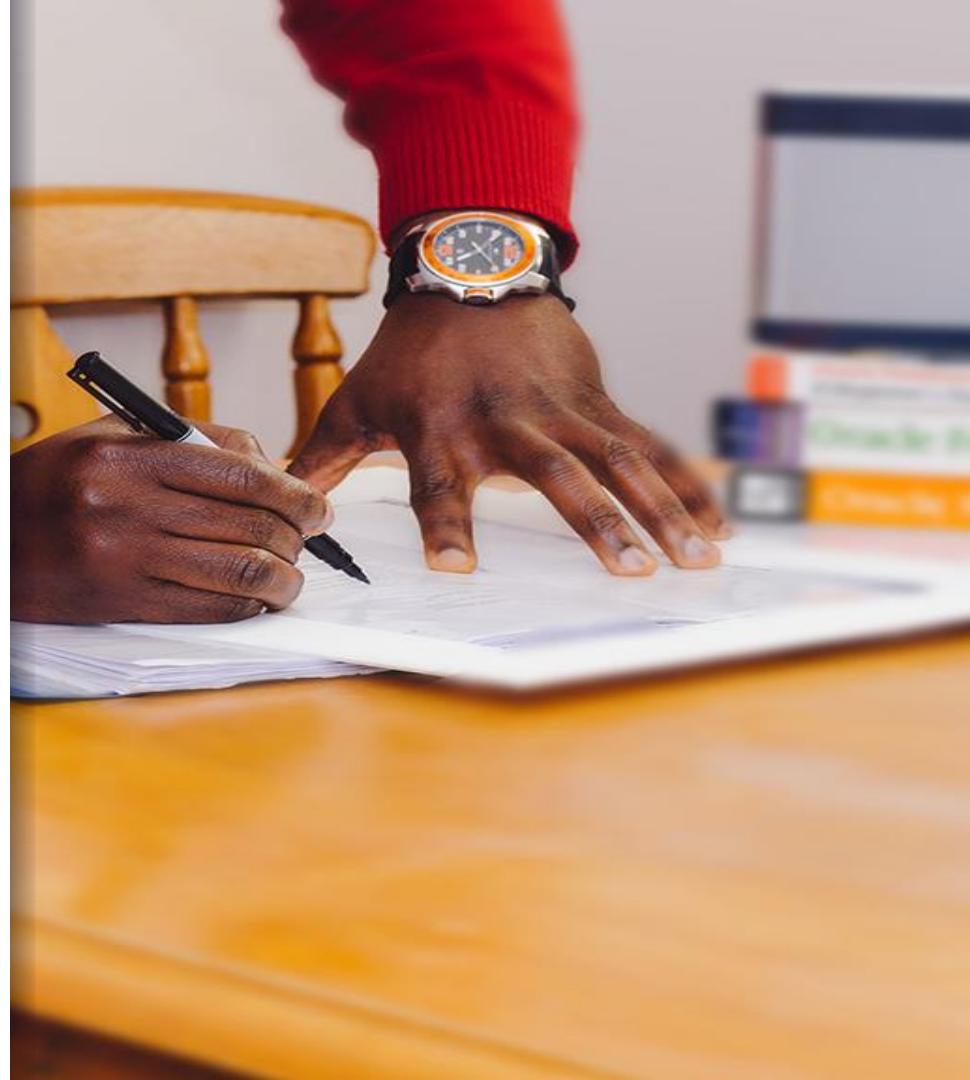

Director of Community
Open Infrastructure Foundation

ildiko@openinfra.dev

Agenda

1. *Open source communities - aims and challenges*
2. *Metrics - friends or enemies?*
3. *CHAOSS project overview*
4. *Case Studies - examples from OpenInfra communities*

Open Source Communities

Aims and Challenges

Success

Sustainability

Growth

Burnout

What is your aim?

What is your challenge?

Metrics

Friends or Enemies?

The Perception of Metrics

©hugh

Data vs Metrics

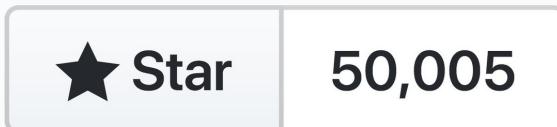

What's Up With GitHub Stars?!

“If your project is not on GitHub it’s not open source”

“Your project is not in the top based on GitHub stars; why should I care?”

“Is contribution equal to PRs (pull requests) and issues?”

CHAOS Overview

CHAOSS Goals

Establish metrics and models
for measuring open source
community health

Produce open source
software and initiatives for
measuring community health

Develop programs for the
deployment of metrics not
attainable through trace data

Work with global partners to
shape how we understand
open source community
health

CHAOSS Metrics

- Individual metrics
 - Covering community, contributions, ecosystem, and more
- Context and implementation
 - Always start with a question
 - Defining the metrics and its usage

All Metrics

View all released metrics.

88 articles

Show all

CHAOSS Metrics Models

- Putting context around a group of metrics and how to use them
 - Why it matters
 - Use cases
 - Metrics
 - Data insights, where available
- Investigate how the model performs on the identified use cases

All Metrics Models

View all released metrics models.

CHAOSS Software

GrimoireLab

Gather, analyze and visualize data of activity, community, and processes of open source projects. Data sources include tools in areas of Code Management, Issues, Code review, Mailing list and more

Augur

A software suite for collecting and measuring structured data about free and open-source software (FOSS) communities. Augur collects trace data from repositories, which it can then synthesize and provide metrics about the measured project.
